Week 6

Posted Jun 9, 2025 5:00 AM

We're into week 6 and headed for the final stretch.

This week the topic begins a shift from the analysis phase to the design phase. Here you will begin modeling by creating UML diagrams for the system design. The idea behind all these different diagrams is to describe the system to different people including database designers, coders, analysts, and users among others. As part of this week's discussion you will create another diagram that will be incorporated into Project Two.

The assignment for this week includes the interpretation of UML diagrams, revising the ATM project. You are asked to identify deficiencies in the diagrams and indicate areas for improvement.

Project Two is due at the end of module 7. Be sure to review the project guidelines. You will be asked to create a Github repository for your project and you will need to add me as a collaborator. My understanding is that you should already have a Github account established from prior courses. So that you can add me as a collaborator, my Github username is nlippincott.
